DISCLAIMER

This document was prepared as an account of work sponsored by an agency of the United States government. Neither the United States government nor Lawrence Livermore National Security, LLC, nor any of their employees makes any warranty, expressed or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness of any information, apparatus, product, or process disclosed, or represents that its use would not infringe privately owned rights. Reference herein to any specific commercial product, process, or service by trade name, trademark, manufacturer, or otherwise does not necessarily constitute or imply its endorsement, recommendation, or favoring by the United States government or Lawrence Livermore National Security, LLC. The views and opinions of authors expressed herein do not necessarily state or reflect those of the United States government or Lawrence Livermore National Security, LLC, and shall not be used for advertising or product endorsement purposes.

This work was performed under the auspices of the U.S. Department of Energy by Lawrence Livermore National Laboratory under Contract DE-AC52-07NA27344.

CONTRIBUTORS

The SUNDIALS library has been developed over many years by a number of contributors. The current SUNDIALS team consists of Cody J. Balos, David J. Gardner, Alan C. Hindmarsh, Daniel R. Reynolds, and Carol S. Woodward. We thank Radu Serban for significant and critical past contributions.

Other contributors to SUNDIALS include: James Almgren-Bell, Lawrence E. Banks, Peter N. Brown, George Byrne, Rujeko Chinomona, Scott D. Cohen, Aaron Collier, Keith E. Grant, Steven L. Lee, Shelby L. Lockhart, John Loffeld, Daniel McGreer, Yu Pan, Slaven Peles, Cosmin Petra, Steven B. Roberts, H. Hunter Schwartz, Jean M. Sexton, Dan Shumaker, Steve G. Smith, Shahbaj Sohal, Allan G. Taylor, Hilari C. Tiedeman, Chris White, Ting Yan, and Ulrike M. Yang.

Chapter 1

Acquiring SUNDIALS

There are two supported ways for building and installing SUNDIALS from source. One option is to use the Spack HPC package manager:

spack install sundials

The second supported option for building and installing SUNDIALS is with CMake. Before proceeding with CMake, the source code must be downloaded. This can be done by cloning the SUNDIALS GitHub repository (run git clone https://github.com/LLNL/sundials), or by downloading the SUNDIALS release compressed archives (.tar. gz) from the SUNDIALS website.

The compressed archives allow for downloading of indvidual SUNDIALS packages. The name of the distribution archive is of the form SOLVER-X.Y.Z.tar.gz, where SOLVER is one of: sundials, cvode, cvodes, arkode, ida, idas, or kinsol, and X.Y.Z represents the version number (of the SUNDIALS suite or of the individual solver). After downloading the relevant archives, uncompress and expand the sources, by running

% tar -zxf SOLVER-X.Y.Z.tar.gz

This will extract source files under a directory SOLVER-X.Y.Z.

Starting with version 2.6.0 of SUNDIALS, CMake is the only supported method of installation. The explanations of the installation procedure begin with a few common observations:

- 1. The remainder of this chapter will follow these conventions:
 - SOLVERDIR is the directory SOLVER-X.Y.Z created above; i.e. the directory containing the SUNDIALS sources.
 - BUILDDIR is the (temporary) directory under which SUNDIALS is built.
 - INSTDIR is the directory under which the SUNDIALS exported header files and libraries will be installed. Typically, header files are exported under a directory INSTDIR/include while libraries are installed under INSTDIR/lib, with INSTDIR specified at configuration time.
- 2. For SUNDIALS' CMake-based installation, in-source builds are prohibited; in other words, the build directory BUILDDIR can **not** be the same as SOLVERDIR and such an attempt will lead to an error. This prevents "polluting" the source tree and allows efficient builds for different configurations and/or options.
- 3. The installation directory INSTDIR can not be the same as the source directory SOLVERDIR.
- 4. By default, only the libraries and header files are exported to the installation directory INSTDIR. If enabled by the user (with the appropriate toggle for CMake), the examples distributed with SUNDIALS will be built together with the solver libraries but the installation step will result in exporting (by default in a subdirectory of the installation directory) the example sources and sample outputs together with automatically generated configuration files that reference the *installed* SUNDIALS headers and libraries. As such, these configuration files for

the SUNDIALS examples can be used as "templates" for your own problems. CMake installs CMakeLists.txt files and also (as an option available only under Unix/Linux) Makefile files. Note this installation approach also allows the option of building the SUNDIALS examples without having to install them. (This can be used as a sanity check for the freshly built libraries.)

Further details on the CMake-based installation procedures, instructions for manual compilation, and a roadmap of the resulting installed libraries and exported header files, are provided in §2 and §2.8.

Chapter 2

Building and Installing with CMake

CMake-based installation provides a platform-independent build system. CMake can generate Unix and Linux Make-files, as well as KDevelop, Visual Studio, and (Apple) XCode project files from the same configuration file. In addition, CMake also provides a GUI front end and which allows an interactive build and installation process.

The SUNDIALS build process requires CMake version 3.12.0 or higher and a working C compiler. On Unix-like operating systems, it also requires Make (and curses, including its development libraries, for the GUI front end to CMake, ccmake or cmake-gui), while on Windows it requires Visual Studio. While many Linux distributions offer CMake, the version included may be out of date. CMake adds new features regularly, and you should download the latest version from http://www.cmake.org. Build instructions for CMake (only necessary for Unix-like systems) can be found on the CMake website. Once CMake is installed, Linux/Unix users will be able to use ccmake or cmake-gui (depending on the version of CMake), while Windows users will be able to use CMakeSetup.

As previously noted, when using CMake to configure, build and install SUNDIALS, it is always required to use a separate build directory. While in-source builds are possible, they are explicitly prohibited by the SUNDIALS CMake scripts (one of the reasons being that, unlike autotools, CMake does not provide a make distclean procedure and it is therefore difficult to clean-up the source tree after an in-source build). By ensuring a separate build directory, it is an easy task for the user to clean-up all traces of the build by simply removing the build directory. CMake does generate a make clean which will remove files generated by the compiler and linker.

2.1 Configuring, building, and installing on Unix-like systems

The default CMake configuration will build all included solvers and associated examples and will build static and shared libraries. The INSTDIR defaults to /usr/local and can be changed by setting the CMAKE_INSTALL_PREFIX variable. Support for FORTRAN and all other options are disabled.

CMake can be used from the command line with the cmake command, or from a curses-based GUI by using the ccmake command, or from a wxWidgets or QT based GUI by using the cmake-gui command. Examples for using both text and graphical methods will be presented. For the examples shown it is assumed that there is a top level SUNDIALS directory with appropriate source, build and install directories:

```
$ mkdir (...)/INSTDIR
$ mkdir (...)/BUILDDIR
$ cd (...)/BUILDDIR
```

2.1.1 Building with the GUI

Using CMake with the ccmake GUI follows the general process:

- 1. Select and modify values, run configure (c key)
- 2. New values are denoted with an asterisk
- 3. To set a variable, move the cursor to the variable and press enter
 - If it is a boolean (ON/OFF) it will toggle the value
 - If it is string or file, it will allow editing of the string
 - For file and directories, the <tab> key can be used to complete
- 4. Repeat until all values are set as desired and the generate option is available (g key)
- 5. Some variables (advanced variables) are not visible right away; to see advanced variables, toggle to advanced mode (t key)
- 6. To search for a variable press the / key, and to repeat the search, press the n key

Using CMake with the cmake-gui GUI follows a similar process:

- 1. Select and modify values, click Configure
- 2. The first time you click Configure, make sure to pick the appropriate generator (the following will assume generation of Unix Makfiles).
- 3. New values are highlighted in red
- 4. To set a variable, click on or move the cursor to the variable and press enter
 - If it is a boolean (ON/OFF) it will check/uncheck the box
 - If it is string or file, it will allow editing of the string. Additionally, an ellipsis button will appear ... on the far right of the entry. Clicking this button will bring up the file or directory selection dialog.
 - For files and directories, the <tab> key can be used to complete
- 5. Repeat until all values are set as desired and click the Generate button
- 6. Some variables (advanced variables) are not visible right away; to see advanced variables, click the advanced button

To build the default configuration using the curses GUI, from the BUILDDIR enter the ccmake command and point to the SOLVERDIR:

\$ ccmake (...)/SOLVERDIR

Similarly, to build the default configuration using the wxWidgets GUI, from the BUILDDIR enter the cmake-gui command and point to the SOLVERDIR:

\$ cmake-gui (...)/SOLVERDIR

The default curses configuration screen is shown in the following figure.

The default INSTDIR for both SUNDIALS and the corresponding examples can be changed by setting the CMAKE_-INSTALL_PREFIX and the EXAMPLES_INSTALL_PATH as shown in the following figure.

Pressing the g key or clicking generate will generate Makefiles including all dependencies and all rules to build SUNDIALS on this system. Back at the command prompt, you can now run:

\$ make

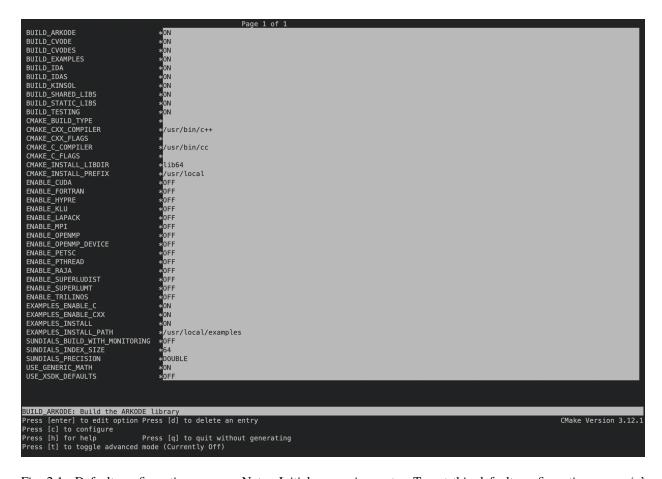

Fig. 2.1: Default configuration screen. Note: Initial screen is empty. To get this default configuration, press 'c' repeatedly (accepting default values denoted with asterisk) until the 'g' option is available.

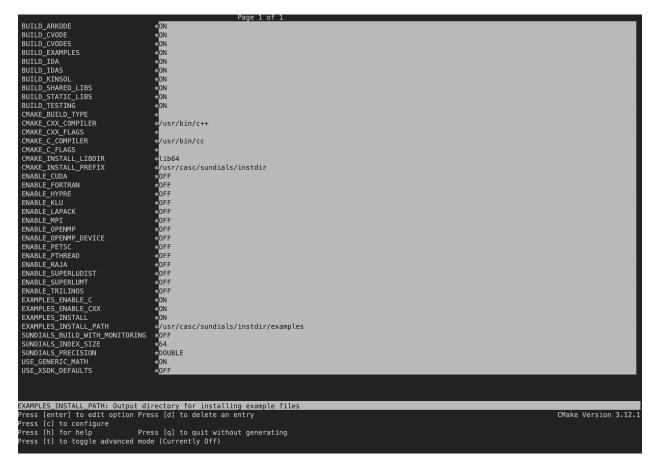

Fig. 2.2: Changing the INSTDIR for SUNDIALS and corresponding EXAMPLES.

or for a faster parallel build (e.g. using 4 threads), you can run

To install SUNDIALS in the installation directory specified in the configuration, simply run:

```
$ make install
```

2.1.2 Building from the command line

Using CMake from the command line is simply a matter of specifying CMake variable settings with the cmake command. The following will build the default configuration:

```
$ cmake -DCMAKE_INSTALL_PREFIX=/home/myname/sundials/instdir \
> -DEXAMPLES_INSTALL_PATH=/home/myname/sundials/instdir/examples \
> ../srcdir
$ make
$ make install
```

2.2 Configuration options (Unix/Linux)

A complete list of all available options for a CMake-based SUNDIALS configuration is provide below. Note that the default values shown are for a typical configuration on a Linux system and are provided as illustration only.

BUILD_ARKODE

Build the ARKODE library

Default: ON

BUILD_CVODE

Build the CVODE library

Default: ON

BUILD_CVODES

Build the CVODES library

Default: ON

BUILD_IDA

Build the IDA library

Default: ON

BUILD_IDAS

Build the IDAS library

Default: ON

BUILD_KINSOL

Build the KINSOL library

Default: ON

BUILD_SHARED_LIBS

Build shared libraries

Default: ON

BUILD_STATIC_LIBS

Build static libraries

Default: ON

CMAKE_BUILD_TYPE

Choose the type of build, options are: Debug, Release, RelWithDebInfo, and MinSizeRel

Default: RelWithDebInfo

Note: Specifying a build type will trigger the corresponding build type specific compiler flag options below which will be appended to the flags set by CMAKE_<language>_FLAGS.

CMAKE_C_COMPILER

C compiler

Default: /usr/bin/cc

CMAKE_C_FLAGS

Flags for C compiler

Default:

CMAKE_C_FLAGS_DEBUG

Flags used by the C compiler during debug builds

Default: -g

CMAKE_C_FLAGS_MINSIZEREL

Flags used by the C compiler during release minsize builds

Default: -Os -DNDEBUG

CMAKE_C_FLAGS_RELEASE

Flags used by the C compiler during release builds

Default: -03 -DNDEBUG

CMAKE_C_STANDARD

The C standard to build C parts of SUNDIALS with.

Default: 99

Options: 99, 11, 17.

CMAKE_C_EXTENSIONS

Enable compiler specific C extensions.

Default: OFF

CMAKE_CXX_COMPILER

C++ compiler

Default: /usr/bin/c++

Note: A C++ compiler is only required when a feature requiring C++ is enabled (e.g., CUDA, HIP, SYCL, RAJA, etc.) or the C++ examples are enabled.

All SUNDIALS solvers can be used from C++ applications without setting any additional configuration options.

CMAKE_CXX_FLAGS

Flags for C++ compiler

Default:

CMAKE_CXX_FLAGS_DEBUG

Flags used by the C++ compiler during debug builds

Default: -g

CMAKE_CXX_FLAGS_MINSIZEREL

Flags used by the C++ compiler during release minsize builds

Default: -Os -DNDEBUG

CMAKE_CXX_FLAGS_RELEASE

Flags used by the C++ compiler during release builds

Default: -03 -DNDEBUG

CMAKE_CXX_STANDARD

The C++ standard to build C++ parts of SUNDIALS with.

Default: 11

Options: 98, 11, 14, 17, 20.

CMAKE_CXX_EXTENSIONS

Enable compiler specific C++ extensions.

Default: OFF

CMAKE_Fortran_COMPILER

Fortran compiler

Default: /usr/bin/gfortran

Note: Fortran support (and all related options) are triggered only if either Fortran-C support (BUILD_FORTRAN_-MODULE_INTERFACE) or LAPACK (ENABLE_LAPACK) support is enabled.

CMAKE_Fortran_FLAGS

Flags for Fortran compiler

Default:

CMAKE_Fortran_FLAGS_DEBUG

Flags used by the Fortran compiler during debug builds

Default: -g

CMAKE_Fortran_FLAGS_MINSIZEREL

Flags used by the Fortran compiler during release minsize builds

Default: -0s

CMAKE_Fortran_FLAGS_RELEASE

Flags used by the Fortran compiler during release builds

Default: -03

CMAKE_INSTALL_LIBDIR

The directory under which libraries will be installed.

Default: Set based on the system: lib, lib64, or lib/<multiarch-tuple>

CMAKE_INSTALL_PREFIX

Install path prefix, prepended onto install directories

Default: /usr/local

Note: The user must have write access to the location specified through this option. Exported SUNDIALS header files and libraries will be installed under subdirectories include and lib of CMAKE_INSTALL_PREFIX, respectively.

ENABLE_CUDA

Build the SUNDIALS CUDA modules.

Default: OFF

CMAKE_CUDA_ARCHITECTURES

Specifies the CUDA architecture to compile for.

Default: sm_30

EXAMPLES_ENABLE_C

Build the SUNDIALS C examples

Default: ON

EXAMPLES_ENABLE_CXX

Build the SUNDIALS C++ examples

Default: OFF

EXAMPLES_ENABLE_CUDA

Build the SUNDIALS CUDA examples

Default: OFF

Note: You need to enable CUDA support to build these examples.

EXAMPLES_ENABLE_F2003

Build the SUNDIALS Fortran2003 examples

Default: ON (if BUILD_FORTRAN_MODULE_INTERFACE is ON)

EXAMPLES_INSTALL

Install example files

Default: ON

Note: This option is triggered when any of the SUNDIALS example programs are enabled (EXAMPLES_-ENABLE_<language> is ON). If the user requires installation of example programs then the sources and sample

output files for all SUNDIALS modules that are currently enabled will be exported to the directory specified by EXAMPLES_INSTALL_PATH. A CMake configuration script will also be automatically generated and exported to the same directory. Additionally, if the configuration is done under a Unix-like system, makefiles for the compilation of the example programs (using the installed SUNDIALS libraries) will be automatically generated and exported to the directory specified by EXAMPLES_INSTALL_PATH.

EXAMPLES_INSTALL_PATH

Output directory for installing example files

Default: /usr/local/examples

Note: The actual default value for this option will be an examples subdirectory created under CMAKE_IN-STALL_PREFIX.

BUILD_FORTRAN_MODULE_INTERFACE

Enable Fortran 2003 interface

Default: OFF

SUNDIALS LOGGING LEVEL

Set the maximum logging level for the SUNLogger runtime API. The higher this is set, the more output that may be logged, and the more performance may degrade. The options are:

- 0 no logging
- $1 \log \text{ errors}$
- 2 log errors + warnings
- 3 log errors + warnings + informational output
- 4 log errors + warnings + informational output + debug output
- 5 log all of the above and even more (e.g. vector valued variables may be logged)

Default: 2

SUNDIALS_BUILD_WITH_MONITORING

Build SUNDIALS with capabilties for fine-grained monitoring of solver progress and statistics. This is primarily useful for debugging.

Default: OFF

Warning: Building with monitoring may result in minor performance degradation even if monitoring is not utilized.

SUNDIALS_BUILD_WITH_PROFILING

Build SUNDIALS with capabilties for fine-grained profiling. This requires POSIX timers or the Windows profileapi.h timers.

Default: OFF

Warning: Profiling will impact performance, and should be enabled judiciously.

SUNDIALS_ENABLE_ERROR_CHECKS

Build SUNDIALS with more extensive checks for unrecoverable errors.

Default: OFF when CMAKE_BUILD_TYPE=Release|RelWithDebInfo `` and ``ON otherwise.

Warning: Error checks will impact performance, but can be helpful for debugging.

ENABLE_GINKGO

Enable interfaces to the Ginkgo linear algebra library.

Default: OFF

Ginkgo_DIR

Path to the Ginkgo installation.

Default: None

SUNDIALS_GINKGO_BACKENDS

Semi-colon separated list of Ginkgo target architecutres/executors to build for. Options currenty supported are REF (the Ginkgo reference executor), OMP, CUDA, HIP, and DPC++.

Default: "REF;OMP"

ENABLE_KOKKOS

Enable the Kokkos based vector.

Default: OFF

Kokkos_DIR

Path to the Kokkos installation.

Default: None

ENABLE_KOKKOS_KERNELS

Enable the Kokkos based dense matrix and linear solver.

Default: OFF

KokkosKernels_DIR

Path to the Kokkos-Kernels installation.

Default: None

ENABLE HIP

Enable HIP Support

Default: OFF

AMDGPU_TARGETS

Specify which AMDGPU processor(s) to target.

Default: None

ENABLE_HYPRE

Flag to enable hypre support

Default: OFF

Note: See additional information on building with *hypre* enabled in §2.4.

HYPRE_INCLUDE_DIR

Path to hypre header files

Default: none

HYPRE LIBRARY

Path to hypre installed library files

Default: none

ENABLE KLU

Enable KLU support

Default: OFF

Note: See additional information on building with KLU enabled in §2.4.

KLU_INCLUDE_DIR

Path to SuiteSparse header files

Default: none

KLU_LIBRARY_DIR

Path to SuiteSparse installed library files

Default: none

ENABLE_LAPACK

Enable LAPACK support

Default: OFF

Note: Setting this option to 0N will trigger additional CMake options. See additional information on building with LAPACK enabled in §2.4.

LAPACK_LIBRARIES

LAPACK (and BLAS) libraries

Default: /usr/lib/liblapack.so;/usr/lib/libblas.so

Note: CMake will search for libraries in your LD_LIBRARY_PATH prior to searching default system paths.

ENABLE_MAGMA

Enable MAGMA support.

Default: OFF

Note: Setting this option to ON will trigger additional options related to MAGMA.

MAGMA_DIR

Path to the root of a MAGMA installation.

Default: none

SUNDIALS_MAGMA_BACKENDS

Which MAGMA backend to use under the SUNDIALS MAGMA interface.

Default: CUDA

ENABLE MPI

Enable MPI support. This will build the parallel nvector and the MPI-aware version of the Many Vector library.

Default: OFF

Note: Setting this option to ON will trigger several additional options related to MPI.

MPI_C_COMPILER

mpicc program

Default:

MPI_CXX_COMPILER

mpicxx program

Default:

Note: This option is triggered only if MPI is enabled (ENABLE_MPI is ON) and C++ examples are enabled (EXAMPLES_ENABLE_CXX is ON). All SUNDIALS solvers can be used from C++ MPI applications by default without setting any additional configuration options other than ENABLE_MPI.

MPI_Fortran_COMPILER

mpif90 program

Default:

Note: This option is triggered only if MPI is enabled (ENABLE_MPI is ON) and Fortran-C support is enabled (EXAMPLES_ENABLE_F2003 is ON).

MPIEXEC_EXECUTABLE

Specify the executable for running MPI programs

Default: mpirun

Note: This option is triggered only if MPI is enabled (ENABLE_MPI is ON).

ENABLE_ONEMKL

Enable oneMKL support.

Default: OFF

ONEMKL_DIR

Path to oneMKL installation.

Default: none

SUNDIALS_ONEMKL_USE_GETRF_LOOP

This advanced debugging option replaces the batched LU factorization with a loop over each system in the batch and a non-batched LU factorization.

Default: OFF

SUNDIALS_ONEMKL_USE_GETRS_LOOP

This advanced debugging option replaces the batched LU solve with a loop over each system in the batch and a non-batched solve.

Default: OFF

ENABLE OPENMP

Enable OpenMP support (build the OpenMP NVector)

Default: OFF

ENABLE_PETSC

Enable PETSc support

Default: OFF

Note: See additional information on building with PETSc enabled in §2.4.

PETSC_DIR

Path to PETSc installation

Default: none

PETSC_LIBRARIES

Semi-colon separated list of PETSc link libraries. Unless provided by the user, this is autopopulated based on the PETSc installation found in PETSC_DIR.

Default: none

PETSC_INCLUDES

Semi-colon separated list of PETSc include directroies. Unless provided by the user, this is autopopulated based on the PETSc installation found in PETSC_DIR.

Default: none

ENABLE_PTHREAD

Enable Pthreads support (build the Pthreads NVector)

Default: OFF

ENABLE_RAJA

Enable RAJA support.

Default: OFF

Note: You need to enable CUDA or HIP in order to build the RAJA vector module.

SUNDIALS_RAJA_BACKENDS

If building SUNDIALS with RAJA support, this sets the RAJA backend to target. Values supported are CUDA, HIP. or SYCL.

Default: CUDA

ENABLE_SUPERLUDIST

Enable SuperLU_DIST support

Default: OFF

Note: See additional information on building with SuperLU_DIST enabled in §2.4.

SUPERLUDIST_DIR

Path to SuperLU_DIST installation.

Default: none

SUPERLUDIST_OpenMP

Enable SUNDIALS support for SuperLU_DIST built with OpenMP

Default: none

Note: SuperLU_DIST must be built with OpenMP support for this option to function. Additionally the environment variable OMP_NUM_THREADS must be set to the desired number of threads.

SUPERLUDIST_INCLUDE_DIRS

List of include paths for SuperLU_DIST (under a typical SuperLU_DIST install, this is typically the SuperLU_DIST SRC directory)

Default: none

Note: This is an advanced option. Prefer to use *SUPERLUDIST_DIR*.

SUPERLUDIST_LIBRARIES

Semi-colon separated list of libraries needed for SuperLU_DIST

Default: none

Note: This is an advanced option. Prefer to use SUPERLUDIST_DIR.

SUPERLUDIST_INCLUDE_DIR

Path to SuperLU_DIST header files (under a typical SuperLU_DIST install, this is typically the SuperLU_DIST SRC directory)

Default: none

Note: This is an advanced option. This option is deprecated. Use SUPERLUDIST_INCLUDE_DIRS.

SUPERLUDIST_LIBRARY_DIR

Path to SuperLU_DIST installed library files

Default: none

Note: This option is deprecated. Use *SUPERLUDIST_DIR*.

ENABLE_SUPERLUMT

Enable SuperLU_MT support

Default: OFF

Note: See additional information on building with SuperLU_MT enabled in §2.4.

SUPERLUMT_INCLUDE_DIR

Path to SuperLU_MT header files (under a typical SuperLU_MT install, this is typically the SuperLU_MT SRC directory)

Default: none

SUPERLUMT_LIBRARY_DIR

Path to SuperLU_MT installed library files

Default: none

SUPERLUMT_THREAD_TYPE

Must be set to Pthread or OpenMP, depending on how SuperLU_MT was compiled.

Default: Pthread

ENABLE SYCL

Enable SYCL support.

Default: OFF

Note: Building with SYCL enabled requires a compiler that supports a subset of the of SYCL 2020 specification (specifically sycl/sycl.hpp must be available).

CMake does not currently support autodetection of SYCL compilers and CMAKE_CXX_COMPILER must be set to a valid SYCL compiler. At present the only supported SYCL compilers are the Intel oneAPI compilers i.e., dpcpp and icpx. When using icpx the -fsycl flag and any ahead of time compilation flags must be added to CMAKE_CXX_FLAGS.

SUNDIALS_SYCL_2020_UNSUPPORTED

This advanced option disables the use of *some* features from the SYCL 2020 standard in SUNDIALS libraries and examples. This can be used to work around some cases of incomplete compiler support for SYCL 2020.

Default: OFF

ENABLE_CALIPER

Enable CALIPER support

Default: OFF

Note: Using Caliper requires setting SUNDIALS_BUILD_WITH_PROFILING to ON.

CALIPER_DIR

Path to the root of a Caliper installation

Default: None

ENABLE_ADIAK

Enable Adiak support

Default: OFF

adiak DIR

Path to the root of an Adiak installation

Default: None

SUNDIALS_LAPACK_CASE

Specify the case to use in the Fortran name-mangling scheme, options are: lower or upper

Default:

Note: The build system will attempt to infer the Fortran name-mangling scheme using the Fortran compiler. This option should only be used if a Fortran compiler is not available or to override the inferred or default (lower) scheme if one can not be determined. If used, SUNDIALS_LAPACK_UNDERSCORES must also be set.

SUNDIALS_LAPACK_UNDERSCORES

Specify the number of underscores to append in the Fortran name-mangling scheme, options are: none, one, or two

Default:

Note: The build system will attempt to infer the Fortran name-mangling scheme using the Fortran compiler. This option should only be used if a Fortran compiler is not available or to override the inferred or default (one) scheme if one can not be determined. If used, SUNDIALS_LAPACK_CASE must also be set.

SUNDIALS_INDEX_TYPE

Integer type used for SUNDIALS indices. The size must match the size provided for the SUNDIALS_INDEX_SIZE option.

Default: Automatically determined based on SUNDIALS_INDEX_SIZE

Note: In past SUNDIALS versions, a user could set this option to INT64_T to use 64-bit integers, or INT32_T to use 32-bit integers. Starting in SUNDIALS 3.2.0, these special values are deprecated. For SUNDIALS 3.2.0 and up, a user will only need to use the *SUNDIALS_INDEX_SIZE* option in most cases.

SUNDIALS_INDEX_SIZE

Integer size (in bits) used for indices in SUNDIALS, options are: 32 or 64

Default: 64

Note: The build system tries to find an integer type of appropriate size. Candidate 64-bit integer types are (in order of preference): int64_t, __int64, long long, and long. Candidate 32-bit integers are (in order of preference): int32_t, int, and long. The advanced option, *SUNDIALS_INDEX_TYPE* can be used to provide a type not listed here.

SUNDIALS_PRECISION

The floating-point precision used in SUNDIALS packages and class implementations, options are: double, single, or extended

Default: double

SUNDIALS_MATH_LIBRARY

The standard C math library (e.g., libm) to link with.

Default: -lm on Unix systems, none otherwise

SUNDIALS_INSTALL_CMAKEDIR

Installation directory for the SUNDIALS cmake files (relative to CMAKE_INSTALL_PREFIX).

Default: CMAKE_INSTALL_PREFIX/cmake/sundials

ENABLE_XBRAID

Enable or disable the ARKStep + XBraid interface.

Default: OFF

Note: See additional information on building with *XBraid* enabled in §2.4.

XBRAID_DIR

The root directory of the XBraid installation.

Default: OFF

XBRAID_INCLUDES

Semi-colon separated list of XBraid include directories. Unless provided by the user, this is autopopulated based on the XBraid installation found in XBRAID_DIR.

Default: none

XBRAID_LIBRARIES

Semi-colon separated list of XBraid link libraries. Unless provided by the user, this is autopopulated based on the XBraid installation found in XBRAID_DIR.

Default: none

USE XSDK DEFAULTS

Enable xSDK (see https://xsdk.info for more information) default configuration settings. This sets CMAKE_BUILD_TYPE to Debug, SUNDIALS_INDEX_SIZE to 32 and SUNDIALS_PRECISION to double.

Default: OFF

2.3 Configuration examples

The following examples will help demonstrate usage of the CMake configure options.

To configure SUNDIALS using the default C and Fortran compilers, and default mpicc and mpif90 parallel compilers, enable compilation of examples, and install libraries, headers, and example sources under subdirectories of /home/myname/sundials/, use:

```
% cmake \
> -DCMAKE_INSTALL_PREFIX=/home/myname/sundials/instdir \
> DETAMNIES INSTALL_PREFIX
```

- > -DEXAMPLES_INSTALL_PATH=/home/myname/sundials/instdir/examples \
- > -DENABLE_MPI=ON \
- > /home/myname/sundials/srcdir

% make install

To disable installation of the examples, use:

```
% cmake \
> -DCMAKE_INSTALL_PREFIX=/home/myname/sundials/instdir \
> -DEXAMPLES_INSTALL_PATH=/home/myname/sundials/instdir/examples \
> -DENABLE_MPI=ON \
> -DEXAMPLES_INSTALL=OFF \
> /home/myname/sundials/srcdir

% make install
```

2.4 Working with external Libraries

The SUNDIALS suite contains many options to enable implementation flexibility when developing solutions. The following are some notes addressing specific configurations when using the supported third party libraries.

2.4.1 Building with Ginkgo

Ginkgo is a high-performance linear algebra library for manycore systems, with a focus on solving sparse linear systems. It is implemented using modern C++ (you will need at least a C++14 compliant compiler to build it), with GPU kernels implemented in CUDA (for NVIDIA devices), HIP (for AMD devices) and SYCL/DPC++ (for Intel devices and other supported hardware). To enable Ginkgo in SUNDIALS, set the <code>ENABLE_GINKGO</code> to ON and provide the path to the root of the Ginkgo installation in <code>Ginkgo_DIR</code>. Additionally, <code>SUNDIALS_GINKGO_BACKENDS</code> must be set to a list of Ginkgo target architecutres/executors. E.g.,

```
% cmake \
> -DENABLE_GINKGO=ON \
> -DGinkgo_DIR=/path/to/ginkgo/installation \
> -DSUNDIALS_GINKGO_BACKENDS="REF;OMP;CUDA" \
> /home/myname/sundials/srcdir
```

The SUNDIALS interfaces to Ginkgo are not compatible with SUNDIALS_PRECISION set to extended.

2.4.2 Building with Kokkos

Kokkos is a modern C++ (requires at least C++14) programming model for witting performance portable code for multicore CPU and GPU-based systems including NVIDIA, AMD, and Intel accelerators. To enable Kokkos in SUNDIALS, set the <code>ENABLE_KOKKOS</code> to ON and provide the path to the root of the Kokkos installation in <code>Kokkos_DIR</code>. Additionally, the Kokkos-Kernels library provides common computational kernels for linear algebra. To enable Kokkos-Kernels in SUNDIALS, set the <code>ENABLE_KOKKOS_KERNELS</code> to ON and provide the path to the root of the Kokkos-Kernels installation in <code>KokkosKernels_DIR</code> e.g.,

```
% cmake \
> -DENABLE_KOKKOS=ON \
> -DKokkos_DIR=/path/to/kokkos/installation \
> -DENABLE_KOKKOS_KERNELS=ON \
> -DKokkosKernels_DIR=/path/to/kokkoskernels/installation \
> /home/myname/sundials/srcdir
```

Note: The minimum supported version of Kokkos-Kernels 3.7.00.

2.4.3 Building with LAPACK

To enable LAPACK, set the ENABLE_LAPACK option to ON. If the directory containing the LAPACK library is in the LD_LIBRARY_PATH environment variable, CMake will set the LAPACK_LIBRARIES variable accordingly, otherwise CMake will attempt to find the LAPACK library in standard system locations. To explicitly tell CMake what library to use, the LAPACK_LIBRARIES variable can be set to the desired libraries required for LAPACK.

```
% cmake \
> -DCMAKE_INSTALL_PREFIX=/home/myname/sundials/instdir \
> -DEXAMPLES_INSTALL_PATH=/home/myname/sundials/instdir/examples \
> -DENABLE_LAPACK=ON \
> -DLAPACK_LIBRARIES=/mylapackpath/lib/libblas.so;/mylapackpath/lib/liblapack.so \
> /home/myname/sundials/srcdir
% make install
```

Note: If a working Fortran compiler is not available to infer the Fortran name-mangling scheme, the options SUNDI-ALS_F77_FUNC_CASE and SUNDIALS_F77_FUNC_UNDERSCORES *must* be set in order to bypass the check for a Fortran compiler and define the name-mangling scheme. The defaults for these options in earlier versions of SUNDIALS were lower and one, respectively.

SUNDIALS has been tested with OpenBLAS 0.3.18.

2.4.4 Building with KLU

KLU is a software package for the direct solution of sparse nonsymmetric linear systems of equations that arise in circuit simulation and is part of SuiteSparse, a suite of sparse matrix software. The library is developed by Texas A&M University and is available from the SuiteSparse GitHub repository.

To enable KLU, set ENABLE_KLU to ON, set KLU_INCLUDE_DIR to the include path of the KLU installation and set KLU_LIBRARY_DIR to the lib path of the KLU installation. In that case, the CMake configure will result in populating the following variables: AMD_LIBRARY, AMD_LIBRARY_DIR, BTF_LIBRARY, BTF_LIBRARY_DIR, COLAMD_LIBRARY, COLAMD_LIBRARY_DIR, and KLU_LIBRARY.

For SuiteSparse 7.4.0 and newer, the necessary information can also be gathered from a CMake import target. If SuiteSparse is installed in a non-default prefix, the path to the CMake Config file can be set using CMAKE_PREFIX_PATH. In that case, the CMake configure step won't populate the previously mentioned variables. It is still possible to set KLU_INCLUDE_DIR and KLU_LIBRARY_DIR which take precedence over a potentially installed CMake import target file.

In either case, a CMake target SUNDIALS::KLU will be created if the KLU library could be found. Dependent targets should link to that target.

SUNDIALS has been tested with SuiteSparse version 5.10.1.

2.4.5 Building with SuperLU DIST

SuperLU_DIST is a general purpose library for the direct solution of large, sparse, nonsymmetric systems of linear equations in a distributed memory setting. The library is developed by Lawrence Berkeley National Laboratory and is available from the SuperLU_DIST GitHub repository.

To enable SuperLU_DIST, set *ENABLE_SUPERLUDIST* to ON, set *SUPERLUDIST_DIR* to the path where SuperLU_DIST is installed. If SuperLU_DIST was built with OpenMP then the option *SUPERLUDIST_OpenMP* and *ENABLE_OPENMP* should be set to ON.

SUNDIALS supports SuperLU_DIST v7.0.0 - v8.x.x and has been tested with v7.2.0 and v8.1.0.

2.4.6 Building with SuperLU_MT

SuperLU_MT is a general purpose library for the direct solution of large, sparse, nonsymmetric systems of linear equations on shared memory parallel machines. The library is developed by Lawrence Berkeley National Laboratory and is available from the SuperLU_MT GitHub repository.

To enable SuperLU_MT, set ENABLE_SUPERLUMT to ON, set SUPERLUMT_INCLUDE_DIR to the SRC path of the SuperLU_MT installation, and set the variable SUPERLUMT_LIBRARY_DIR to the lib path of the SuperLU_MT installation. At the same time, the variable SUPERLUMT_LIBRARIES must be set to a semi-colon separated list of other libraries SuperLU_MT depends on. For example, if SuperLU_MT was build with an external blas library, then include the full path to the blas library in this list. Additionally, the variable SUPERLUMT_THREAD_TYPE must be set to either Pthread or OpenMP.

Do not mix thread types when building SUNDIALS solvers. If threading is enabled for SUNDIALS by having either ENABLE_OPENMP or ENABLE_PTHREAD set to ON then SuperLU_MT should be set to use the same threading type.

SUNDIALS has been tested with SuperLU_MT version 3.1.

2.4.7 Building with PETSc

The Portable, Extensible Toolkit for Scientific Computation (PETSc) is a suite of data structures and routines for simulating applications modeled by partial differential equations. The library is developed by Argonne National Laboratory and is available from the PETSc GitLab repository.

To enable PETSc, set ENABLE_PETSC to ON, and set PETSC_DIR to the path of the PETSc installation. Alternatively, a user can provide a list of include paths in PETSC_INCLUDES and a list of complete paths to the PETSc libraries in PETSC_LIBRARIES.

SUNDIALS is regularly tested with the latest PETSc versions, specifically up to version 3.18.1 as of SUNDIALS version v7.0.0. SUNDIALS requires PETSc 3.5.0 or newer.

2.4.8 Building with hypre

hypre is a library of high performance preconditioners and solvers featuring multigrid methods for the solution of large, sparse linear systems of equations on massively parallel computers. The library is developed by Lawrence Livermore National Laboratory and is available from the hypre GitHub repository.

To enable *hypre*, set ENABLE_HYPRE to ON, set HYPRE_INCLUDE_DIR to the include path of the *hypre* installation, and set the variable HYPRE_LIBRARY_DIR to the lib path of the *hypre* installation.

Note: SUNDIALS must be configured so that SUNDIALS_INDEX_SIZE is compatible with HYPRE_BigInt in the *hypre* installation.

SUNDIALS is regularly tested with the latest versions of *hypre*, specifically up to version 2.26.0 as of SUNDIALS version v7.0.0.

2.4.9 Building with MAGMA

The Matrix Algebra on GPU and Multicore Architectures (MAGMA) project provides a dense linear algebra library similar to LAPACK but targeting heterogeneous architectures. The library is developed by the University of Tennessee and is available from the UTK webpage.

To enable the SUNDIALS MAGMA interface set ENABLE_MAGMA to ON, MAGMA_DIR to the MAGMA installation path, and SUNDIALS_MAGMA_BACKENDS to the desired MAGMA backend to use with SUNDIALS e.g., CUDA or HIP.

SUNDIALS has been tested with MAGMA version v2.6.1 and v2.6.2.

2.4.10 Building with oneMKL

The Intel oneAPI Math Kernel Library (oneMKL) includes CPU and DPC++ interfaces for LAPACK dense linear algebra routines. The SUNDIALS oneMKL interface targets the DPC++ routines, to utilize the CPU routine see §2.4.3.

To enable the SUNDIALS one MKL interface set ENABLE_ONEMKL to ON and ONEMKL_DIR to the one MKL installation path.

SUNDIALS has been tested with oneMKL version 2021.4.

2.4.11 Building with CUDA

The NVIDIA CUDA Toolkit provides a development environment for GPU-accelerated computing with NVIDIA GPUs. The CUDA Toolkit and compatible NVIDIA drivers are available from the NVIDIA developer website.

To enable CUDA, set ENABLE_CUDA to ON. If CUDA is installed in a nonstandard location, you may be prompted to set the variable CUDA_TOOLKIT_ROOT_DIR with your CUDA Toolkit installation path. To enable CUDA examples, set EXAMPLES_ENABLE_CUDA to ON.

SUNDIALS has been tested with the CUDA toolkit versions 10 and 11.

2.4.12 Building with HIP

HIP(heterogeneous-compute interface for portability) allows developers to create portable applications for AMD and NVIDIA GPUs. HIP can be obtained from HIP GitHub repository.

To enable HIP, set ENABLE_HIP to ON and set AMDGPU_TARGETS to the desired target(ex. gfx705). In addition, set CMAKE_C_COMPILER and CMAKE_CXX_COMPILER to point to an installation of hipcc.

SUNDIALS has been tested with HIP versions between 5.0.0 to 5.4.3.

2.4.13 Building with RAJA

RAJA is a performance portability layer developed by Lawrence Livermore National Laboratory and can be obtained from the RAJA GitHub repository.

Building SUNDIALS RAJA modules requires a CUDA, HIP, or SYCL enabled RAJA installation. To enable RAJA, set ENABLE_RAJA to ON, set SUNDIALS_RAJA_BACKENDS to the desired backend (CUDA, HIP, or SYCL), and set ENABLE_CUDA, ENABLE_HIP, or ENABLE_SYCL to ON depending on the selected backend. If RAJA is installed in a nonstandard location you will be prompted to set the variable RAJA_DIR with the path to the RAJA CMake configuration file. To enable building the RAJA examples set EXAMPLES_ENABLE_CXX to ON.

SUNDIALS has been tested with RAJA version 0.14.0.

2.4.14 Building with XBraid

XBraid is parallel-in-time library implementing an optimal-scaling multigrid reduction in time (MGRIT) solver. The library is developed by Lawrence Livermore National Laboratory and is available from the XBraid GitHub repository.

To enable XBraid support, set ENABLE_XBRAID to ON, set XBRAID_DIR to the root install location of XBraid or the location of the clone of the XBraid repository.

Note: At this time the XBraid types braid_Int and braid_Real are hard-coded to int and double respectively. As such SUNDIALS must be configured with SUNDIALS_INDEX_SIZE set to 32 and SUNDIALS_PRECISION set to double. Additionally, SUNDIALS must be configured with ENABLE_MPI set to ON.

SUNDIALS has been tested with XBraid version 3.0.0.

2.5 Testing the build and installation

If SUNDIALS was configured with EXAMPLES_ENABLE_<language> options to ON, then a set of regression tests can be run after building with the make command by running:

% make test

Additionally, if EXAMPLES_INSTALL was also set to ON, then a set of smoke tests can be run after installing with the make install command by running:

% make test_install

2.6 Building and Running Examples

Each of the SUNDIALS solvers is distributed with a set of examples demonstrating basic usage. To build and install the examples, set at least of the EXAMPLES_ENABLE_<language> options to ON, and set EXAMPLES_INSTALL to ON. Specify the installation path for the examples with the variable EXAMPLES_INSTALL_PATH. CMake will generate CMakeLists.txt configuration files (and Makefile files if on Linux/Unix) that reference the *installed* SUNDIALS headers and libraries.

Either the CMakeLists.txt file or the traditional Makefile may be used to build the examples as well as serve as a template for creating user developed solutions. To use the supplied Makefile simply run make to compile and generate the executables. To use CMake from within the installed example directory, run cmake (or ccmake or cmake-gui to

use the GUI) followed by make to compile the example code. Note that if CMake is used, it will overwrite the traditional Makefile with a new CMake-generated Makefile.

The resulting output from running the examples can be compared with example output bundled in the SUNDIALS distribution.

Note: There will potentially be differences in the output due to machine architecture, compiler versions, use of third party libraries etc.

2.7 Configuring, building, and installing on Windows

CMake can also be used to build SUNDIALS on Windows. To build SUNDIALS for use with Visual Studio the following steps should be performed:

- 1. Unzip the downloaded tar file(s) into a directory. This will be the SOLVERDIR
- 2. Create a separate BUILDDIR
- 3. Open a Visual Studio Command Prompt and cd to BUILDDIR
- 4. Run cmake-gui ../SOLVERDIR
 - a. Hit Configure
 - b. Check/Uncheck solvers to be built
 - c. Change CMAKE_INSTALL_PREFIX to INSTDIR
 - d. Set other options as desired
 - e. Hit Generate
- 5. Back in the VS Command Window:
 - a. Run msbuild ALL_BUILD.vcxproj
 - b. Run msbuild INSTALL.vcxproj

The resulting libraries will be in the INSTDIR.

The SUNDIALS project can also now be opened in Visual Studio. Double click on the ALL_BUILD.vcxproj file to open the project. Build the whole *solution* to create the SUNDIALS libraries. To use the SUNDIALS libraries in your own projects, you must set the include directories for your project, add the SUNDIALS libraries to your project solution, and set the SUNDIALS libraries as dependencies for your project.

2.8 Installed libraries and exported header files

Using the CMake SUNDIALS build system, the command

\$ make install

will install the libraries under LIBDIR and the public header files under INCLUDEDIR. The values for these directories are INSTDIR/lib and INSTDIR/include, respectively. The location can be changed by setting the CMake variable CMAKE_INSTALL_PREFIX. Although all installed libraries reside under LIBDIR/lib, the public header files are further organized into subdirectories under INCLUDEDIR/include.

The installed libraries and exported header files are listed for reference in the table below. The file extension .LIB is typically .so for shared libraries and .a for static libraries. Note that, in this table names are relative to LIBDIR for libraries and to INCLUDEDIR for header files.

Warning: SUNDIALS installs some header files to INSTDIR/include/sundials/priv. All of the header files in this directory are private and **should not be included in user code**. The private headers are subject to change without any notice and relying on them may break your code.

2.9 Using SUNDIALS in your prpject

After building and installing SUNDIALS, using SUNDIALS in your application involves two steps: including the right header files and linking to the right libraries.

Depending on what features of SUNDIALS that your application uses, the header files needed will vary. For example, if you want to use CVODE for serial computations you need the following includes:

```
#include <cvode/cvode.h>
#include <nvector/nvector_serial.h>
```

If you wanted to use CVODE with the GMRES linear solver and our CUDA enabled vector:

```
#include <cvode/cvode.h>
#include <nvector/nvector_cuda.h>
#include <sunlinsol/sunlinsol_spgmr.h>
```

The story is similar for linking to SUNDIALS. Starting in v7.0.0, all applications will need to link to libsundials_core. Furthermore, depending on the packages and modules of SUNDIALS of interest an application will need to link to a few more libraries. Using the same examples as for the includes, we would need to also link to libsundials_cvode, libsundials_nvecserial for the first example and libsundials_cvode, libsundials_nveccuda, libsundials_sunlinsolspgmr for the second.

Refer to the documentations sections for the individual packages and modules of SUNDIALS that interest you for the proper includes and libraries to link to.

2.10 Using SUNDIALS as a Third Party Library in other CMake Projects

The make install command will also install a CMake package configuration file that other CMake projects can load to get all the information needed to build against SUNDIALS. In the consuming project's CMake code, the find_package command may be used to search for the configuration file, which will be installed to instdir/SUNDIALS_INSTALL_CMAKEDIR/SUNDIALSConfig.cmake alongside a package version file instdir/SUNDIALS_INSTALL_CMAKEDIR/SUNDIALSConfigVersion.cmake. Together these files contain all the information the consuming project needs to use SUNDIALS, including exported CMake targets. The SUNDIALS exported CMake targets follow the same naming convention as the generated library binaries, e.g. the exported target for CVODE is SUNDIALS::cvode. The CMake code snipped below shows how a consuming project might leverage the SUNDIALS package configuration file to build against SUNDIALS in their own CMake project.

```
project(MyProject)

# Set the variable SUNDIALS_DIR to the SUNDIALS instdir.

# When using the cmake CLI command, this can be done like so:
```

(continues on next page)

(continued from previous page)

```
# cmake -D SUNDIALS_DIR=/path/to/sundials/installation

find_package(SUNDIALS REQUIRED)

add_executable(myexec main.c)

# Link to SUNDIALS libraries through the exported targets.

# This is just an example, users should link to the targets appropriate

# for their use case.
target_link_libraries(myexec PUBLIC SUNDIALS::cvode SUNDIALS::nvecpetsc)
```

2.11 Table of SUNDIALS libraries and header files
